FindMyCharlie: project progress

Jia Hao Liang · October 25–28, 2026 · all times Eastern Live map: https://flbjcy.github.io/find-my-charlie/ **Source:** https://github.com/flbjcy/find-my-charlie

FindMyCharlie began as a way to turn scattered Reddit comments about eight limited-edition CharlieCard designs into a simple, usable map. It now combines reviewed Reddit sightings with reports submitted directly by collectors. A pin opens the card, machine, exit, observation time, source, and confidence details. It is an independent community project, not an MBTA service.

Progress by time

The times below are rounded to the hour from source-control history. They date published code changes, not necessarily the moment an idea was discussed or a station was visited.

When (ET)	What changed
Oct 25, 6 PM	Built the first shared sightings map and report API. Added the eight card designs, station and exit data, subway shapes, and a form for community reports. The map uses OpenStreetMap tiles without a paid map key.
Oct 26, 1–2 PM	Added reviewed Reddit reports and refined the map-first interface. Replaced generic card symbols with cropped photos of the eight real card designs so collectors can recognize them quickly.
Oct 26, 9 PM	Corrected Green Line geometry near Back Bay using MBTA route shapes; the earlier plotted line was wrong.
Oct 26, 11 PM	Published the frontend on GitHub Pages, using the same shared backend for reports. Renamed the public site **FindMyCharlie** and moved it to `/find-my-charlie/`. Removed a failing manual Reddit-sync message from the main interface.
Oct 26, 11 PM	Added anonymous public traffic totals. Updated the lemon-yellow header and author credit, including Garamond type and a sharper, smaller circular Beijing subway emblem linked to Jia Hao Liang's personal GitHub Pages site.
Oct 27, 2–10 AM	Expanded reviews beyond the first thread into related Reddit discussions and nested replies. Corrected the treatment of sold-out or broken machines so older positive reports do not keep appearing as current stock.
Oct 27, 11 AM–2 PM	Clarified machine-specific sightings such as North Station silver and Harvard yellow. Added card photos to the report form, a direct “Report unavailable” action, and grouped same-card reports ranked by recency, corroboration, machine detail, and conflicting evidence. Started the private report-and-evidence archive.
Oct 27, 2–5 PM	Corrected an edited Haymarket machine description without pretending the sighting was new. Fixed duplicate station pins, including State, by showing one pin per station and grouping its cards and machines. Adjusted label placement to reduce overlapping white boxes and made pointer lines stop at box edges.
Oct 27, 5–11 PM	Continued publishing supported sightings and corrections from Reddit and community reports, including separate Harvard machines and a North Station dark-blue report. Added a newly developing FindMyCharlie discussion to the review registry.
Oct 28, 1 AM	A user pointed out that a Tufts Medical Center comment had been missed. Full-size photo review identified the orange Old State House card and machine **221072**, observed **Oct 27 at 8:30 PM**. A follow-up check found an older Airport silver report in another thread. Both reports were added to the reviewed data; the prior thumbnail-based exclusion was recorded as an error.

Problems we found and how we handled them

Problem	Change or current status
Comments were spread across multiple threads and nested replies.	Tracked relevant discussions, kept source links and review notes, and reviewed reply context. Hourly checks compare recent comments; wider expanded reviews are scheduled daily. Coverage is reported honestly when older or collapsed comments cannot be opened.
Reddit's server API was blocked.	Used browser-reviewed reports rather than pretending the map had a live Reddit feed. Community submissions go into the shared backend immediately; Reddit additions depend on the scheduled review and successful publication.
A report could be stale after cards sold out or a machine broke.	Kept negative observations in history and hid superseded availability for the same machine and card. A negative for one machine does not erase a different machine at the same station.
Harvard yellow and Forest Hills green seemed missing or inconsistent.	Separated machine-specific reports and their observation times. Harvard 221121 sold out while 221123 had later positive reports; Forest Hills 221270 had a later negative while separate community reports identified 221100. The map now preserves these distinctions.
A single station appeared as two pins.	Grouped reports by station before drawing markers, so State has one pin with its different machines and cards inside.
Many reports for one card made a station panel hard to scan.	Grouped by card, ranked current machine reports by recency and corroboration, and put earlier reports in expandable history. Longer prose alone does not raise confidence.
White station labels overlapped and pointer lines crossed boxes.	Added a layout pass that finds freer positions around each station and clips connector lines at label edges. Dense maps can still be constrained by screen size and zoom.
The Green Line path near Back Bay was inaccurate.	Replaced the incorrect plotted section with MBTA route geometry. Lines are geographic context, not live service status.
A Tufts photo report was missed.	Full-size inspection revealed the orange card and machine number that were not in the comment text. This correction is recorded as a review error rather than silently rewriting the audit. A related-thread check also found an older Airport silver report. Other photo-only reports need the same explicit visual check.
Public data needed a recoverable history.	Created a private GitHub archive of dated report-feed snapshots, including community submissions, plus reviewed Reddit evidence and coverage notes. It is not a complete verbatim copy of every Reddit comment.

Measured snapshot

At **about 1:35 AM ET on October 28**, before the Tufts correction was published, the live site showed **388 page views** and **362 visits** in its 90-day anonymous traffic dashboard. It served **97 report entries**: **46 community reports** and **51 reviewed Reddit reports**, including historical and unavailable entries. These are report entries, not unique people or currently available machines. Visits are approximate browser-tab sessions; reloads add page views. The dashboard excludes known bots and privacy opt-outs. The count will change as new reports arrive.

How the system works now

GitHub Pages serves the public map at the address above. A shared Sites backend stores community reports and serves the report feed, while reviewed Reddit evidence is incorporated through published source updates. Official MBTA station, entrance, and route geometry supplies map context; when a comment does not identify an entrance, the site says **Exit unknown**. The map deliberately avoids claiming that an older sighting guarantees stock today. The private archive is kept separately from the public website repository.

What remains imperfect

Reddit browser access is not guaranteed, and an hourly review is not instant or exhaustive. Photo-only details, deep replies, edits, and ambiguous station language need manual attention. Visitor counts are approximate, and machine availability can change between any observation and a collector's arrival. Future reviews should inspect full-size images attached to candidate comments before excluding a sighting.

Evidence and links

- Public website and code
- Original r/mbta discussion
- Tufts Medical Center photo report
- Public traffic dashboard
- MBTA V3 API

The timeline was reconstructed from the project and GitHub commit histories; the traffic and report totals were read from the live site at the stated time. The private archive contains fuller review evidence and dated report snapshots.
